Dear Hiring Manager,

I'm writing to apply for a Frontend or Software Developer role on your team. I'm a Frontend Developer with 2.5+ years of experience at HomeLane, where I build and own customer-facing products with React.js, Next.js and Redux. I also work in TypeScript, and I care about building frontends that move real business numbers.

At HomeLane, I built the entire frontend of two products. Supernova is a guided platform that turns client answers into a personalised interior design summary, and it now drives a steady flow of leads and design appointments. HomeLane Vastu is an AI-powered tool where users upload a floor plan and get a personalised Vastu plan back.

I also focus on work that has a clear business result. I replaced the pincode field in our lead forms with a city dropdown, which cut form drop-offs and saved the company about ₹75 lakh in ad spend. I raised homelane.com's Lighthouse score from 50 to 80+ through image optimization, code splitting and CLS fixes. And I moved 30+ hand-updated landing pages into one Strapi template, so the marketing team now edits content without needing a developer.

Beyond building features, I take ownership of the details that keep a product reliable. That includes Redux state, OTP verification, payment flows, and WebEngage and Microsoft Clarity event tracking across full form funnels. When a production bug hits our forms, I find and fix it within a day.

Outside work, I built and launched two products of my own, TextToHand AI and AgeCalcNow. TextToHand AI now gets 50+ daily users from organic search alone, with zero ad spend.

I'd bring the same ownership and focus on results to your team, and I'd welcome the chance to talk about how I can help. Thank you for your time and consideration.

Sincerely,
Arpit Goyal
